

Ideation Phase

Brainstorm & Idea Prioritization (Detailed)

Project: Freelancer Web Application (MERN Stack)

Date	10 April 2026
Team ID	Your Team ID
Project Name	Freelancer Web Application (MERN)
Maximum Marks	4 Marks

Introduction to Brainstorming

Brainstorming is a creative problem-solving technique used to generate a large number of ideas in a short period of time. It encourages free thinking, collaboration, and innovation without immediate criticism. In software development, brainstorming helps identify user needs, system features, and potential solutions before actual development begins.

For the Freelancer Web Application, brainstorming was conducted to understand the real-world challenges faced by freelancers and clients and to design a platform that effectively solves these issues using the MERN stack (MongoDB, Express.js, React.js, Node.js).

Step-1: Team Gathering & Problem Identification

In this step, the team collaborated to discuss and identify the core problem. Various issues in existing freelancing platforms were analyzed.

Identified Problems:

- Difficulty in finding genuine clients and freelancers
- Lack of trust and transparency in transactions
- High competition and low visibility for beginners
- Payment security and delayed transactions
- Complex user interfaces in existing platforms

After discussion, the team finalized the main problem as: **'Lack of a simple, secure, and transparent freelancing platform for beginners and clients.'**

Step-2: Brainstorming & Idea Generation

During brainstorming, all team members contributed ideas freely. The goal was to generate maximum ideas without filtering them initially.

- Develop a freelancer marketplace platform
- Implement secure user authentication (JWT)
- Create freelancer profile with portfolio
- Enable job posting for clients
- Introduce bidding/proposal system
- Add real-time chat functionality
- Integrate secure payment gateway
- Provide rating and review system
- Develop admin dashboard for monitoring
- Add AI-based freelancer recommendation
- Enable skill-based search and filtering

Idea Grouping:

To better understand and organize ideas, they were grouped into categories:

Core Functionalities: Job posting, freelancer profiles, bidding system

Advanced Features: AI recommendation, real-time chat

Trust & Security: Payment gateway, ratings & reviews

Step-3: Idea Prioritization

After generating ideas, prioritization was performed based on two factors: importance and feasibility. This helps in selecting features that are both impactful and implementable within the project scope.

Feature	Importance	Feasibility
Job Posting System	High	High
Freelancer Profiles	High	High
Bidding System	High	Medium
Chat System	Medium	Medium
Payment Gateway	High	Medium
AI Recommendation	Low	Low

Final Idea Selection

Based on brainstorming and prioritization, the final idea selected is to develop a **MERN-based Freelancer Marketplace Web Application**.

Justification:

- Solves real-world problems faced by freelancers and clients
- High demand and practical relevance
- Technically feasible using MERN stack
- Scalable and can include advanced features in future
