

Problem–Solution Fit Canvas (Detailed)

Project: Freelancer Web Application (MERN Stack)

Introduction

The Problem–Solution Fit Canvas helps in understanding the relationship between customer needs and the proposed solution. It focuses on identifying customer segments, their problems, behaviors, and constraints, and aligning them with a suitable solution. This ensures that the developed system solves real-world problems effectively.

For the Freelancer Web Application, this canvas is used to analyze both freelancers and clients, ensuring that the MERN-based solution provides value, usability, and efficiency.

1. Customer Segments

The primary users of the system are freelancers (students, developers, designers) and clients (startups, businesses, individuals). Freelancers seek job opportunities, while clients seek skilled professionals for their projects.

2. Jobs-to-be-Done / Problems

Freelancers want to find genuine job opportunities and build their careers. Clients want to hire skilled freelancers efficiently. However, both face challenges such as lack of trust, difficulty in verification, and inefficient communication.

3. Triggers

Triggers include financial needs of freelancers, project deadlines of clients, and the need for quick hiring solutions. External triggers like advertisements, recommendations, and online searches also influence user actions.

4. Emotions (Before/After)

Before using the platform, users feel frustrated, confused, and uncertain due to unreliable systems. After using an efficient platform, they feel confident, satisfied, and productive.

5. Available Solutions

Existing platforms such as Upwork, Fiverr, and LinkedIn provide freelancing services. However, they often involve high competition, complex interfaces, and lack of transparency.

6. Customer Constraints

Constraints include limited budgets, high competition, lack of trust, and technical barriers. Freelancers may lack visibility, while clients may face difficulty in selecting the right candidate.

7. Behaviour

Users browse platforms, apply for jobs, compare profiles, and communicate with potential clients or freelancers. They rely heavily on reviews, ratings, and portfolio information.

8. Channels

Online channels include websites, mobile apps, and social media platforms. Offline channels include referrals, networking events, and word-of-mouth recommendations.

9. Root Cause

The root cause of these problems is the lack of a simple, transparent, and trustworthy freelancing platform. Existing systems fail to provide proper verification and seamless user experience.

10. Your Solution

The proposed solution is a MERN-based Freelancer Web Application that includes features such as user authentication, job posting, bidding system, real-time chat, secure payment integration, and ratings & reviews. This solution aims to provide a transparent, efficient, and user-friendly platform.

Conclusion

The Problem–Solution Fit Canvas clearly demonstrates how the proposed MERN-based Freelancer platform addresses real-world challenges. It aligns customer needs with technological solutions, ensuring a successful and impactful application.
